Personal Laptop Risk Assessment Report

Cybersecurity Risk Assessment

PREPARED BY	Ivana Tanoh
DATE	February, 2026
DOCUMENT TYPE	Cybersecurity Risk Assessment

Table of Contents

1. Purpose

The purpose of this risk assessment is to identify, evaluate, and prioritize cybersecurity risks associated with a personal computing environment. This assessment examines potential threats, vulnerabilities, and corresponding mitigation strategies to strengthen overall security posture and reduce exposure to cyber incidents.

2. Scope

This assessment includes the following assets:

- Personal laptop
- Email account
- Wi-Fi network
- Online accounts
- Operating system
- Personal files
- Web browser
- Public Wi-Fi usage
- USB ports

These assets support daily computing activities and may be exposed to cybersecurity threats if not properly secured.

Risk Identification

The following key cybersecurity risks were identified:

- Malware infection resulting from downloading untrusted files
- Phishing attacks targeting email accounts
- Unauthorized access due to weak or reused passwords
- Data loss caused by absence of backup solutions
- Credential theft from insecure password storage
- Exploitation of vulnerabilities due to outdated software

If unmitigated, these risks may result in data breaches, privacy compromise, financial loss, or system disruption.

Risk Mitigation Strategies

To reduce identified risks, the following controls are recommended:

- Install and maintain updated antivirus software
- Use strong, unique passwords for all accounts
- Enable multi-factor authentication (MFA)
- Configure automatic operating system and software updates
- Secure Wi-Fi networks with strong encryption and passwords
- Avoid unsecured public Wi-Fi or utilize a VPN
- Implement regular data backup procedures
- Use a secure password manager

These controls reduce both the likelihood and impact of cybersecurity threats.

Conclusion

This risk assessment identified multiple cybersecurity risks within a personal computing environment. By implementing the recommended mitigation strategies, overall risk exposure can be significantly reduced and security posture strengthened.

Risk Assessment Matrix

Asset	Threat	Vulnerability	Likelihood	Impact	Risk Level	Mitigation
Laptop	Malware infection	Downloading unknown files	Medium	High	High	Install antivirus software and update regularly
Email	Phishing attack	Opening unknown emails	High	High	High	Use spam protection
Wi-Fi	Unauthorized access	Weak password	Medium	High	High	Implement strong Wi-Fi encryption and complex passwords
Online Accounts	Account takeover	Weak or reused passwords	High	High	High	Use strong unique passwords and enable two-factor authentication
Operating System	System exploitation	Outdated software	Medium	High	High	Enable automatic system updates
Personal Files	Data loss	No backup available	Medium	High	High	Use cloud backup
Browser	Credential theft	Saved passwords in browser	Medium	Medium	Medium	Use password manager instead of saving passwords in browser
Public WiFi Usage	Man-in-the-middle attack	Using unsecured public WiFi	Medium	High	High	Avoid public WiFi or use VPN
USB Ports	Malware infection	Connecting unknown USB devices	Low	High	Medium	Only use trusted USB devices

Asset by Risk Level
