

Netflix Risk Assessment Report

Cybersecurity Risk Assessment

PREPARED BY	Ivana Tanoh
DATE	February , 2026
DOCUMENT TYPE	Cybersecurity Risk Assessment

Table of Contents

- 1. Purpose**
- 2. Scope**
 - 2.1 Assessed Assets
- 3. Risk Identification**
- 4. Risk Mitigation Strategies**
- 5. Risk Assessment Matrix**
- 6. Likelihood and Risk Level by Asset**
- 7. Conclusion**

Purpose

The purpose of this risk assessment is to identify, evaluate, and prioritize cybersecurity risks associated with Netflix's digital environment. This assessment examines potential threats, vulnerabilities, and corresponding mitigation strategies to strengthen overall security posture and reduce exposure to cyber incidents.

Scope

This assessment covers the following Netflix assets:

- User accounts
- Payment system
- Website
- Mobile applications
- Video content
- User data
- APIs
- Customer support system

These assets support business operations and subscriber services and may be exposed to cybersecurity threats if not properly secured.

Risk Identification

The following key cybersecurity risks were identified during this assessment:

- Account hacking due to weak or reused passwords
- Fraud within the payment system
- Malware risks affecting the mobile application
- Unauthorized access to video content through account sharing
- API exploitation due to weak authentication controls
- Social engineering attacks targeting customer support staff
- Data breaches involving user information
- Unauthorized website logins

If not properly mitigated, these risks could result in financial loss, service disruption, reputational damage, and loss of customer trust.

Risk Mitigation Strategies

To reduce the likelihood and impact of these risks, the following controls are recommended:

- Enforce strong password requirements and multi-factor authentication (MFA)
- Monitor payment transactions for suspicious activity
- Require regular mobile application updates
- Limit the number of devices per account to reduce account sharing
- Strengthen API authentication and monitor access activity
- Provide employee training to prevent social engineering attacks
- Encrypt sensitive user data and strengthen data protection controls
- Implement login alerts to detect unauthorized website access

These mitigation strategies improve Netflix's overall security posture and reduce exposure to cyber threats.

Conclusion

This risk assessment identified multiple cybersecurity risks affecting Netflix's digital environment. By implementing the recommended controls, Netflix can significantly reduce risk exposure, protect user data, and maintain customer trust.

Risk Assessment Matrix

Asset	Threat	Vulnerability	Likelihood	Impact	Risk Level	Mitigation
User Accounts	Credential stuffing/ Account hacking	Weak or reused passwords	High	High	High	Require strong, unique passwords and MFA
Payment System	Fraud	No transaction monitoring	Medium	High	High	Monitor payments and implement fraud detection
Mobile App	Malware	Outdated app versions	Medium	Medium	Medium	Force app updates
Video Content	Unauthorized access	Account sharing	Low	High	Medium	Limit number of devices per account
APIs	Exploitation	Weak authentication controls	Medium	Medium	Medium	Require authentication and monitor access
Customer Support System	Social engineering attacks	Employees may trust fake users	Medium	Medium	Medium	Security training and phishing awareness
User Data	Data leak / breach	Weak data protection	Medium	High	High	Encrypt and secure user data
Website	Unauthorized login	No login alerts	Medium	High	High	Send login alerts to users

Likelihood and Risk Level by Asset
